Enhancing Internet Banking Security

In order to enhance our Internet Banking security, we have deployed TLS 1.2 (Transport Layer Security) security patch to Internet Banking web server. Usually all the latest browsers are enabled with TLS 1.0 or higher and will work properly with this enhanced security feature. However, few browsers with older version may not work properly due to the security enhancement. In such cases, you need to manually change the browser security settings to access EBL Internet Banking service. In this regard we are requesting you to change the browser setting by following the three simple steps.

How to Enable TLS for using Internet Banking

Step 1: Click the ‘Start’ icon (it should be at the bottom-left corner of your device screen)

Step 2: Type in ‘inetcpl.cpl’ as shown in the above diagram and press enter. It should take you to the below screen.
Step 3: Go to ‘Advanced’ tab, and scroll down until you find ‘Security’ section. You should see the following sign:  Security. Un-tick all boxes with ‘SSL’ and tick all boxes with TLS. Click ‘Apply’ and then ‘OK’. You should be able to access EBL Internet Banking smoothly.
